## **CLAIMS**

- 1. A method for breaking a futile collection cycle in a train algorithm, wherein a
- 2 collection-set includes at least the oldest car in the oldest train, the method comprising
- 3 the steps of:
- determining when a futile cycle has been entered,
- identifying a car outside the collection-set in the oldest train, where the identified
- 6 car contains an object referenced from outside the oldest train,
- adding the identified car to the collection to form an augmented collection-set,
- 8 and
- 9 collecting the augmented collection-set including scanning intervening cars.
- 1 2. The method of claim 1 further wherein the step of identifying includes the step of
- 2 using information about the references to objects in cars in the oldest train collected dur-
- 3 ing prior collections.
- The method of claim 1 wherein the step of identifying includes the step of using
- information about the references to objects in cars in the oldest train collected during the
- 3 current collection.
- 1 4. The method of claim 1 wherein the reference from outside the oldest train is a ref-
- 2 erence from a younger train.
- 5. The method of claim 1 wherein the reference from outside the oldest train is a ref-
- 2 erence from outside the generation.
- 1 6. The method of claim 1 wherein the step of determining comprises the steps of:
- 2 measuring the volume of the oldest train before a collection,
- measuring the volume of the oldest train after a collection, wherein if no volume
- 4 reduction has been found, a futile collection cycle has been entered.

- 7. The method of claim 6 further comprising the steps of:
- establishing a threshold for the number of times that a collection cycle has re-
- sulted in no reduction in the volume of the collection set,
- saving the number of times that a collection cycle has resulted in no reduction in
- the volume of the collection set, wherein when the threshold is reached a futile collection
- 6 cycle has been entered.
- 1 8. The method of claim 7 further comprising the steps of:
- tracking the number of times on a no progress counter that a collection cycle has
- resulted in no reduction in the volume of the oldest train, and
- 4 comparing the no progress counter to the threshold.
- 9. A garbage collector using the train algorithm, wherein a collection set includes at
- 2 least the oldest car in the oldest train, and including means for breaking a futile cycle, the
- 3 collector comprising:
- 4 means for determining when a futile cycle has been entered,
- 5 means for identifying a car outside the collection-set in the oldest train, where the
- 6 identified car contains an object referenced from outside the oldest train,
- means for adding the identified car to the collection to form an augmented collec-
- 8 tion-set, and
- 9 means for collecting the augmented collection-set including scanning intervening
- 10 cars.
- 1 10. The garbage collector of claim 9 further wherein the means for identifying in-
- 2 cludes means for using information about the references to objects in cars in the oldest
- train collected during prior collections.
- 1 11. The garbage collector of claim 9 wherein the means for identifying includes
- 2 means for using information about the references to objects in cars in the oldest train
- 3 collected during the current collection.

- 1 12. The garbage collector of claim 9 wherein the reference from outside the oldest
- train is a reference from a younger train.
- 1 13. The garbage collector of claim 9 wherein the reference from outside the oldest
- train is a reference from outside the generation.
- 1 14. The collector of claim 9 wherein the means for determining comprises:
- means for measuring the volume of the oldest train before a collection,
- means for measuring the volume of the oldest train after a collection,
- wherein if no volume reduction has been found, a futile collection cycle has been
- 5 entered.

1

- 15. The collector of claim 14 further comprising:
- means for establishing a threshold for the number of times that a collection cycle
- has resulted in no reduction in the volume of the collection set,
- means for saving the number of times that a collection cycle has resulted in no re-
- duction in the volume of the collection set, wherein when the threshold is reached a futile
- 6 collection cycle has been entered.
  - 16. The collector of claim 9 further comprising:
- means for tracking the number of times on a no progress counter that a collection
- 3 cycle has resulted in no reduction in the volume of the oldest train, and
- 4 means for comparing the no progress counter to the threshold.
- 1 17. A computer readable storage media comprising media containing instructions for
- execution in a processor for the practice of a method for breaking a futile collection cycle
- in a train algorithm, wherein a collection set includes at least the oldest car in the oldest
- 4 train, the method comprising the steps of:
- determining when a futile cycle has been entered,
- identifying a car outside the collection-set in the oldest train, where the identified
- 7 car contains an object referenced from outside the oldest train,

- adding a found younger car to the collection to form an augmented collection set,
- 9 and
- collecting the augmented collection set.
- 1 18. The computer readable storage media of claim 17 further comprising media con-
- taining further instructions for the practice of a method comprising the step of identifying
- includes the step of using information about the references to objects in cars in the oldest
- 4 train collected during prior collections.
- 1 19. The computer readable storage media of claim 17 further comprising media con-
- taining further instructions for the practice of a method comprising the step of identifying
- includes the step of using information about the references to objects in cars in the oldest
- 4 train collected during the current collection.
- 1 20. The computer readable storage media of claim 17 wherein the reference from out-
- side the oldest train is a reference from a younger train.
- 1 21. The computer readable storage media of claim 17 wherein the reference from out-
- side the oldest train is a reference from outside the generation.
- 1 22. The computer readable storage media of claim 18 further comprising media con-
- taining further instructions for the practice of a method comprising steps of:
- measuring the volume of the oldest train before a collection,
- 4 measuring the volume of the oldest train after a collection,
- wherein if no volume reduction has been found, a futile collection cycle has been
- 6 entered.
- 23. The computer readable storage media of claim 22 further comprising media con-
- taining further instructions for the practice of a method comprising steps of:
- establishing a threshold for the number of times that a collection cycle has re-
- sulted in no reduction in the volume of the collection set,

- saving the number of times that a collection cycle has resulted in no reduction in
- the volume of the collection set, wherein when the threshold is reached a futile collection
- 7 cycle has been entered.
- 1 24. The computer readable storage media of claim 23 further comprising media con-
- taining further instructions for the practice of a method comprising steps of:
- tracking the number of times on a no progress counter that a collection cycle has
- 4 resulted in no reduction in the volume of the oldest train, and
- 5 comparing the no progress counter to the threshold.
- 1 25. Electromagnetic signals propagating on a computer network comprising electro-
- 2 magnetic signals carrying instructions to one or more processors for execution thereon for
- the practice of a method for breaking a futile collection cycle in a train algorithm,
- 4 wherein a collection set includes at least the oldest car in the oldest train, the method
- 5 comprising the steps of:
- determining when a futile cycle has been entered,
- identifying a car outside the collection-set in the oldest train, where the identified
- 8 car contains an object referenced from outside the oldest train,
- adding the identified car to the collection to form an augmented collection-set,
- 10 and
- collecting the augmented collection-set including scanning intervening cars.
- 1 26. The electromagnetic signals propagating on a computer network of claim wherein
- the step of identifying includes the step of using information about the references to ob-
- jects in cars in the oldest train collected during prior collections.
- 1 27. The electromagnetic signals propagating on a computer network of claim wherein
- the step of identifying includes the step of using information about the references to ob-
- jects in cars in the oldest train collected during the current collection.

- 1 28. The electromagnetic signals propagating on a computer network of claim wherein
- the reference from outside the oldest train is a reference from a younger train.
- 1 29. The electromagnetic signals propagating on a computer network of claim wherein
- the reference from outside the oldest train is a reference from outside the generation.
- 1 30. The electromagnetic signals propagating on a computer network of claim 25 fur-
- ther comprising electromagnetic signals carrying instructions for the steps of:
- if no younger cars are found with objects referenced from younger trains, then
- finding and adding a car with an external reference to the collection set to form a
- second augmented collection set, and
- 6 collecting the second augmented collection set.
- 1 31. The electromagnetic signals propagating on a computer network of claim 25 fur-
- ther comprising electromagnetic signals carrying instructions for the steps of:
- measuring the volume of the oldest train before a collection,
- 4 measuring the volume of the oldest train after a collection,
- wherein if no volume reduction has been found, a futile collection cycle has been
- 6 entered.
- 1 32. The electromagnetic signals propagating on a computer network of claim 31 fur-
- ther comprising electromagnetic signals carrying instructions for the steps of::
- establishing a threshold for the number of times that a collection cycle has re-
- sulted in no reduction in the volume of the collection set,
- saving the number of times that a collection cycle has resulted in no reduction in
- the volume of the collection set, wherein when the threshold is reached a futile collection
- 7 cycle has been entered.
- 33. The electromagnetic signals propagating on a computer network of claim 25 fur-
- ther comprising electromagnetic signals carrying instructions for the steps of:

- tracking the number of times on a no progress counter that a collection cycle has
- 4 resulted in no reduction in the volume of the oldest train, and
- 5 comparing the no progress counter to the threshold.
